# THE Go-to Security Solution for Residential Developments

***Access8™ is straightforward and easily scalable, with features and capabilities to support the requirements of architects, developers, project managers, and end users.***

With over a decade in business and thirty years in IT and information security sales, Wayne Wilder specializes in access control systems and system integration projects, with a focus on access controls for private residential communities and amenity centers. When it comes to access control, Wilder has learned:

- Developers and construction project managers want a system that is easily managed on-site during the various phases of construction.
- After completion of construction, community management associations and property managers want a system that can be maintained easily either on-site or remotely using internet connectivity.
- And homeowners - who are the final and possibly most important customers in the process - want managed access to their communities. Allowing only residents, invited guests and designated service personnel entry.
- Afterwards when the system is in daily use by the community: reliability and the capability to grow with the community are also highly valued by homeowners.

“My primary customers are often developers and project managers,” says Wilder. “They just want a door access system that meets the minimal description of access control; however, they are also keen on the idea of a system that will meet everyone’s needs – although undefined - after the project is completed.”

## **Simple and Streamlined**

For the reasons described, Wilder has found that the Access8™ Door Control System from First Choice Building Products is in high demand among his clients.

“My clients have been pleased with Access8 and have found it to be a great match for their requirements and ultimately their customers. We’re constantly getting new installation requests.”

The First Choice Access8 system provides access control for up to eight doors and is universally compatible with all standard readers, keypads, key fobs, and smart phones. With the Access8’s touchscreen controls, users can easily manage multiple door IDs, set schedules and control different access levels.

A signature feature of the system for untrained users and experienced clients is the ease by which they can add new users to the system using the touchpad screen – similar to their smartphone.

## **Flexibility for Growing Properties**

“The ability to scale and the industry-leading feature set of the Access8 system – as well as its competitive price point – make it an attractive option for our clients. With the extraordinary growth in the North Texas area, demand for solutions like the Access8 system will not be slowing anytime soon.”
